

The Macintosh for Music and Digital Audio

The perfect lyrics or a killer guitar riff can strike at any time. But merely getting notes on paper is not enough to capture today's sound. Which is why Apple makes sure your Macintosh is ready. We ship every Mac with built-in audio capabilities to accelerate the creative process. So musicians can take their music out of the studio, onto their laptops, into their homes—even over the web. In short, anywhere your music takes you.

Macintosh—the industry standard

Macintosh has long been the choice of professional musicians due to the close integration of hardware and software for the recording, manipulation, and playback of digital audio. Furthermore, Apple's adoption of USB and FireWire technology means that Mac users can instantly connect digitizers, MIDI devices, and DAT storage drives, to capture high-quality 44.1 audio tracks at ultrafast speeds.

Mac OS

The Mac OS has a number of built-in technologies that make computing significantly easier. Mac OS 9 includes powerful search tools, PC compatibility, speech technology, and Internet capabilities to enhance productivity and deliver seamless integration between programs. AppleScript delivers new features for automating workflows with easily written scripts from local IP networks or over the Internet. These powerful built-in technologies add critical support to many music applications. More important, they virtually eliminate the need for artists to become troubleshooters.

QuickTime

With QuickTime 4, music producers also have the ability to stream digital content, delivering MIDI, MP3, or Qdesign compressed audio over the Internet. This means millions of people who have QuickTime software are ready to receive your audio files from CDs or over the World Wide Web.
